UK Construction Monitor

Q4 2022

Construction workloads viewed as flat-lining over the course of the next twelve months

- Challenging macro environment increasingly visible in the construction industry
- Infrastructure remains a beacon of light as private residential indicators slow
- Skills shortages persist despite more difficult operating environment
- Financial constraints having an increasing impact on the sector

The overall tone to the Q4 2022 RICS UK Construction Monitor is, unsurprisingly, one of greater caution and this is also reflected in the comments from the more than 2,000 respondents to the survey. The headline indicator capturing workloads across the industry suggests that activity is now flat-lining in the face of the increasingly challenging macro environment (net balance of -1% compared to +17% previously), with the scale of the loss of momentum clearly visible in Chart 1.

Private sector workload readings begin to soften

Significantly, the feedback from contributors suggests that the loss of impetus in workloads is most visible in parts of the private sector with housing at the forefront of this (net balance of -13% against +17% in Q3), followed by private commercial and industrial (both metrics at -2%). This is demonstrated in Chart 2. By way of contrast, responses around infrastructure, while less buoyant than previously, are still pointing to a positive trend (net balance +22%) and the same is the case for the categories of 'other public works' and 'public housing'. Within infrastructure, the strongest readings continue to be found in the energy component where the net balance of +45% was little changed from Q3 and only marginally lower than the +54% average recorded in the first half of the year.

Financial constraints are an increasing issue

When it comes to the key challenges the industry is facing, respondents continue to emphasise shortages of both labour and materials as still being particularly important. But, while the share of contributors highlighting these factors is beginning to decline (Chart 5), the proportion identifying financial constraints as an obstacle has now risen for four consecutive quarters to reach 62% (the highest level since Q3 2020). This pattern is also evident in insights provided around credit availability in the industry. A net balance of 46% indicated that credit conditions had worsened over the past three months with a similar amount anticipating a further deterioration over the next three months (Chart 11). Looking out over the next year, a net balance of 35% are projecting that credit conditions will be tougher than they currently are which, while still significant, is some way off the 60% that took this view in the last iteration of the survey. Meanwhile, the macro woes are beginning to manifest themselves in the share of respondents pointing to inadequate demand; this has climbed to 28% which, although still low by historic standards, is the highest level since the midst of the Covid pandemic. Anecdotal remarks from contributors also continue to focus on concerns around the

planning system.

Recruitment challenges still broadly based

It is interesting that despite the flatter trend in activity and concerns raised about financial constraints, the issue of hiring is still viewed as challenging. A net balance of +35% of respondents reported having recruited employees over the past three months (Chart 10) with +15% indicating they intend to do so over the next twelve months (Chart 12). The ongoing shortage of skills appears as prevalent amongst the trades as amongst professionals. More than 50% of contributors report difficulties in hiring quantity surveyors and other construction professionals including project managers. Meanwhile, a broadly similar share point to problems is sourcing bricklayers, electricians, and plumbers. Perhaps unsurprisingly in view of this, there is still a focus on committing investment to workforce development and training even if this is a little less so than previously; a net balance of +17% point to plans to increase spending in this area, albeit down from a recent high of +37%.

Activity likely to be subdued in 2023

Having been on a rising trend through the course of the past two years, business enquiries lost momentum in the final quarter of last year, with the net balance reading little changed from Q3. This is also reflected in the responses to the expectations for workloads over the next twelve months. (Chart 4). But significantly, there continues to be a marked divergence as to how this will play out in different parts of the industry. The feedback around the prospects for infrastructure are still quite encouraging, although the reading of +22% is lower than the +32% in the previous three-month period. However, the expectations for private residential are a little more circumspect while, for now at least, not being overly negative (net balance of -11%), and for private non-residential (-5% compared with +2%).

Profit indicators turn a little more negative

The headline net balance metric for profit margins over the next year has softened again to -26%, the most negative number since Q3 2020. Meanwhile, although point projections for both tender prices and construction costs have eased, the former has done so by a little more than the latter (Chart 14). This would be consistent with further pressures on margins. Skilled labour costs are still viewed as likely to increase by around 7% in aggregate, reflecting the challenges around recruitment highlighted earlier.

Methodology

The RICS UK Construction Monitor is a quarterly sentiment survey of Chartered Surveyors who operate across the UK. Data collection began in 1994 with additional questions introduced subsequently.

<https://www.rics.org/uk/news-insight/research/market-surveys/>

Total responses in Q4 2022= 2082

Regions:

- The 'headline' national readings cover Great Britain.
- Specifically, the five regions that comprise the national figure are: (1) London and South East, (2) South West/Wales, (3) Midlands/East Anglia, (4) North West/ North East/ Yorks & Humber, and (5) Scotland. Data on Northern Ireland are not included in the headline figure.
- National data are regionally weighted.

Sectors:

"Other public works" comprises factories, warehouses, oil, steel, coal, schools/colleges, universities, health, offices, entertainment, garages, shops and agriculture.

For sector definitions, <http://www.ons.gov.uk/ons/rel/construction/construction-statistics/no--16--2015-edition/pdf-construction-statistics-appendix-2.pdf>.

Net balance data:

- Net balance = Proportion of respondents reporting a rise in prices minus those reporting a fall (i.e. if 30% reported a rise and 5% reported a fall, the net balance will be 25%).
- The net balance measures breadth (how widespread e.g. price falls or rises are on balance), rather than depth (the magnitude of e.g. price falls or rises).
- Net balance data is opinion based; it does not quantify actual changes in an underlying variable.
- Net balance data can range from -100 to +100.
- A positive net balance implies that more respondents are seeing increases than decreases (in the underlying variable), a negative net balance implies that more respondents are seeing decreases than increases and a zero net balance implies an equal number of respondents are seeing increases and decreases.
- Therefore, a -100 reading implies that no respondents are seeing increases (or no change), and a +100 reading implies that no respondents are seeing decreases (or no change).
- In the case of the RICS price balance, a reading of +10 should not be interpreted as RICS saying that house prices are going up by 10%, but that 10% more surveyors reported increases rather than decreases in prices (over the last three months).
